

Procurement of monitoring equipment

Air quality monitoring is an essential activity in the Air Quality Directives of the European Union. The methodologies for measurement of air pollution from stationary sources and in ambient air are described in normative standards from CEN, the European Committee for Standardization.

In the process of meeting the EU requirements for air quality and air pollution monitoring, FORCE Technology and National Environmental Research Institute (NERI) have assisted several European laboratories in tendering and procurement of equipment for measurement of air pollution.

Typical activities involved in this service are:

- Assessment of needs for instrumentation according to
 - EU's directives
 - Available resources
 - Local conditions
- Specification of equipment according to the specific needs
- Assistance in tendering procedures
- Assistance in procurement
- Assistance in training and capacity building.

The joint co-operation between NERI and FORCE Technology ensures a highly skilled and versatile support to international clients in all fields of air pollution. FORCE Technology and NERI have assisted in the air pollution engineering activities in several countries in Eastern Europe (Latvia, Estonia, Slovakia, Poland, Bulgaria and Romania) and in Asia (Vietnam, Nepal, Bhutan, Malaysia, Philippines).

FORCE Technology and NERI are both well established as national Danish reference laboratories in the field of air pollution monitoring

with more than 40 years of experience within research and development in the field of air pollution.

The Danish Environmental Protection Agency (EPA) has appointed FORCE Technology as the national Danish reference laboratory for air emission monitoring, and NERI as the national Danish reference laboratory for air quality monitoring. Experts from both laboratories assist in the transfer of know how to other countries, and in the establishment and implementation of national reference laboratories.
